LT4356 Surge Stopper: Overvoltage Protection Regulator and Inrush Current Limiter

In industrial applications, high voltage power supply spikes with durations ranging from a few microseconds to hundreds of milliseconds are commonly encountered. The electronics in these systems must not only survive transient voltage spikes, but in many cases also operate reliably throughout the event.

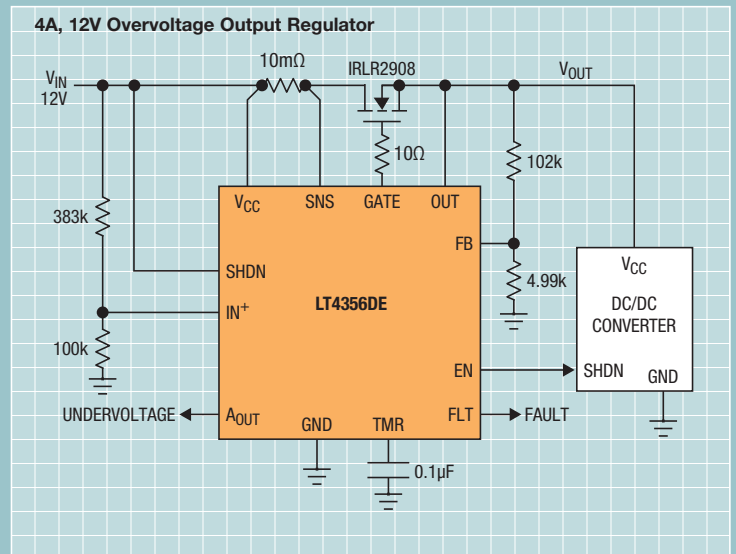

The LT[®]4356 Surge Stopper reduces the need for bulky filtering components (capacitors, inductors, TVS diodes, fuses) by isolating low voltage circuitry from damaging spikes and surges found in industrial systems. The LT4356 offers complete front end protection, guards against overloads and short circuits, and withstands input voltage reversal with a simple IC/MOSFET solution. The LT4356 also protects against DC overvoltage and overcurrent, which ordinary surge suppressors cannot do.

Under normal conditions, the LT4356 drives the MOSFET fully on, so that input power passes through directly to the load, with very little loss. If the input voltage rises above an adjustable output threshold, the LT4356 regulates the output at a safe level. The regulating action eliminates the need to use high voltage rated components downstream. Instead, less costly components may be used, because the LT4356 blocks high voltages from reaching them.

The LT4356 provides the ability to ride out transients for continued system operation. If the fault persists, an adjustable timer sets a time limit to ensure the MOSFET stays within its operating limits before the load is disconnected and the system is shut down. The timer capacitor is charged with a current proportional to the voltage drop, V_{ds} . For an overcurrent fault, the timer charging current is increased. This unique feature takes more advantage of the Safe Operating Area (SOA) of the MOSFET than would a fixed timer interval, allowing the user to size the MOSFET appropriately for their surge requirements.

LT4356 Features:

- Stops High Voltage Surges
- Adjustable Output Clamp Voltage
- Overcurrent Protection
- Wide Operation Range: 4V to 80V
- Reverse Input Protection to -60V
- Low 7 μ A Shutdown Current, LT4356-1/LT4356-3
- Adjustable Fault Timer
- Inrush Current Limiting
- Controls N-Channel MOSFET
- Shutdown Pin Withstands -60V to 100V
- Fault Output Indication
- Spare Amplifier for Level Detection Comparator or Linear Regulator Controller
- Guaranteed Operation to 125°C
- Latchoff Operation (LT4356-3)
- Automatic Retry (LT4356-1, LT4356-2)
- Available in (4mm \times 3mm) 12-Pin DFN, 10-Pin MSOP or 16-Pin SO Packages

Overvoltage Protection Regulates Output at 27V During Transient

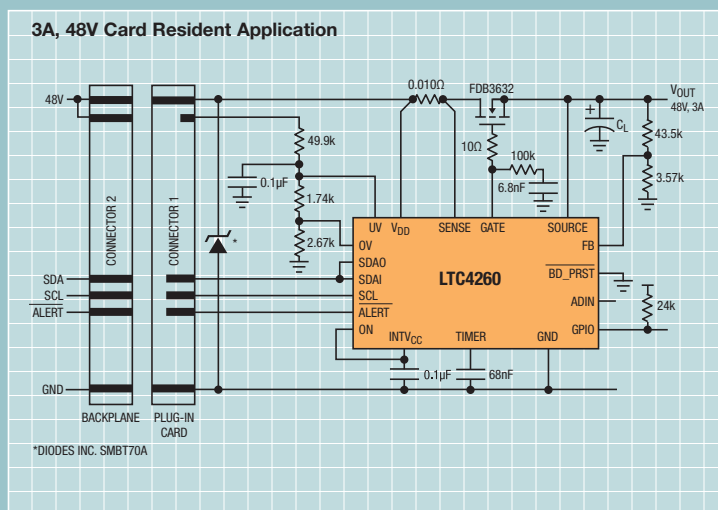

Hot Swap Controllers – High Voltage

Hot Swap controllers allow a circuit board to be safely inserted and removed from a live backplane. Using an N-channel pass MOSFET, the board supply voltage can be ramped at an adjustable rate. Product features include independent adjustable inrush current and overcurrent limits to minimize stresses on the pass MOSFET during start-up, input step, and output step short-circuit conditions. Newer generation devices include an onboard ADC for board voltage and current monitoring, and an I²C interface for microcontroller interaction.

LTC®4260: Positive High Voltage Hot Swap Controller with I²C Compatible Monitoring

Features:

- Allows Safe Insertion into Live Backplane
- 8-Bit ADC Monitors Current and Voltage
- I²C/SMBus Interface
- Wide Operating Voltage Range: 8.5V to 80V
- High Side Drive for External N-Channel MOSFET
- Input Overvoltage/Undervoltage Protection
- Optional Latchoff or Autoretry After Faults
- Alerts Host After Faults
- Foldback Current Limiting

Hot Swap Controllers – Low Voltage

Low voltage Hot Swap controllers include independent high side gate drivers to control single or dual voltages, as well as voltage power-up and power-down ramp control, current foldback and inrush limiting. Our latest LTC4217 and LTC4218 Hot Swap products allow the current limit threshold to be adjusted dynamically using an external pin. Additional features include a current monitor output that amplifies the sense resistor voltage for ground referenced current sensing and a MOSFET temperature monitor output. Dedicated 12V versions contain preset 12V-specific thresholds.

LTC4215: Hot Swap Controller with I²C Compatible Monitoring

Features:

- Allows Safe Insertion into Live Backplane
- 8-Bit ADC Monitors Current and Voltage
- I²C/SMBus Interface
- Wide Operating Voltage Range: 2.9V to 15V
- dI/dt Controlled Soft-Start
- High Side Drive for External N-Channel MOSFET
- No External Gate Capacitor Required
- Input Overvoltage/Undervoltage Protection
- Optional Latchoff or Auto-Retry After Faults
- Alerts Host After Faults
- Inrush Current Limit with Foldback
- Available in 24-Lead (4mm × 5mm) QFN and 16-Lead Narrow SSOP Packages

Part Number	Channels	Input Voltage Range	Inrush Control	Overcurrent Control	Fault Output	PWRGD/Reset	Description	Package
Low Voltage Hot Swap Controllers								
LTC4210-1/2/3/4	1	2.7V to 16.5V	Active or Ramp	ACL ¹	Yes		Active Current Limiting with a Circuit Breaker. Latchoff/Auto-Retry Operation	SOT-23

ORing Ideal Diode Controllers

Linear's family of ideal diode controllers reduces forward voltage drop and power dissipation in ORing applications, eliminating the heat sinks required by conventional rectifiers. They deliver smooth switchover without chatter and are free from oscillation in load sharing applications, yet respond quickly when called upon to block DC current in the reverse state. Our controllers prevent backfeeding between supplies and are easily configured to protect against reverse polarity inputs.

Ideal Diode Controllers – High Voltage

LTC4354: Negative Voltage Diode-OR Controller and Monitor

The LTC4354 is a negative voltage and the LTC4355 is a positive voltage diode-OR controller that drive two external N-channel MOSFETs. Each replaces two Schottky diodes and the associated heat sink, saving power and space. The power dissipation is greatly reduced by using N-channel MOSFETs as the pass transistors. Power sources can be easily ORed together to increase total system power and reliability.

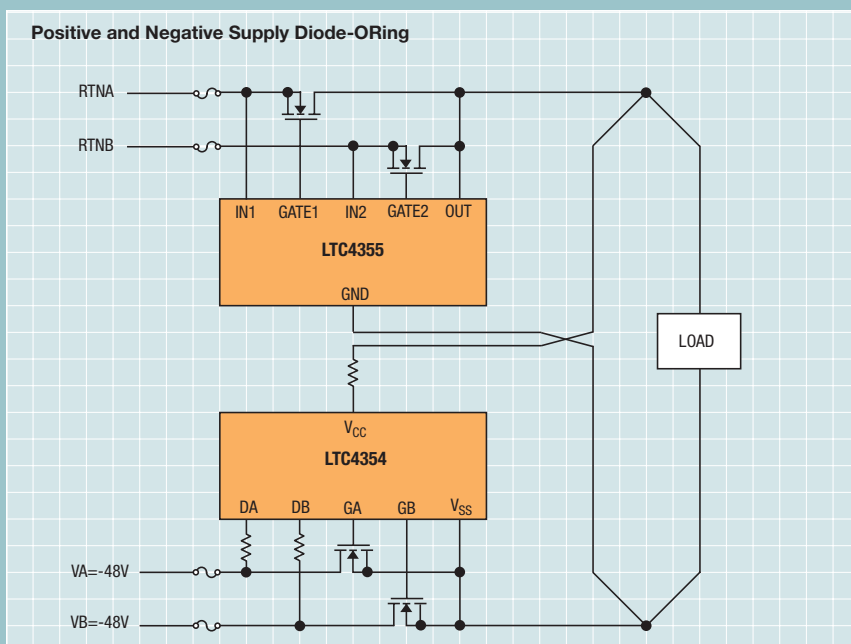

LTC4355: Positive High Voltage Dual Ideal Diode-OR with Input Supply and Fuse Monitors

The LTC4355 can diode-OR two positive supplies or the return paths of two negative supplies, such as in a -48V system. Power fault detection indicates if the input supplies are not in regulation, the inline fuses are blown, or the voltages across the MOSFETs are greater than the fault threshold.

Features:

- Replaces Power Schottky Diodes
- Controls N-Channel MOSFETs
- $0.5\mu\text{s}$ Turn-Off Time Limits Peak Fault Current
- Wide Operating Voltage Range: 9V to 80V
- Smooth Switchover without Oscillation
- No Reverse DC Current
- Monitors V_{IN} , Fuse and MOSFET Diode
- Available in 14-Lead (4mm \times 3mm) DFN, 16-Lead MS and SO Packages

Power Dissipation vs Load Current

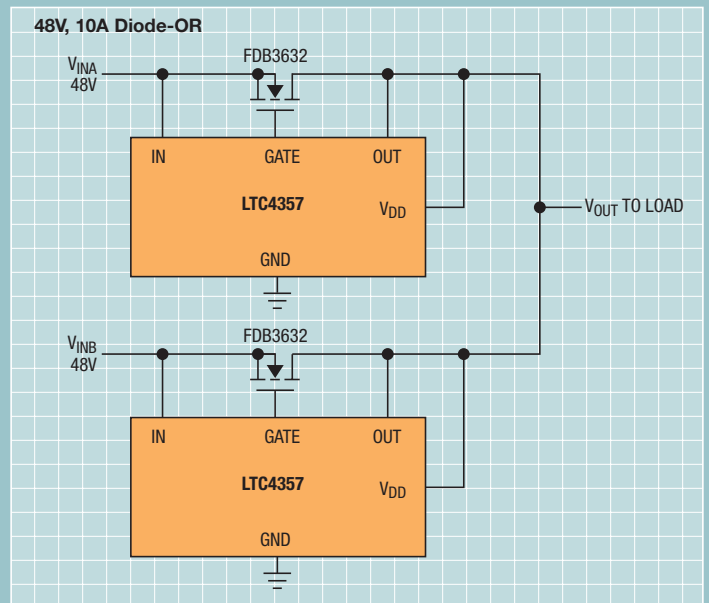

LTC4357: Positive High Voltage Ideal Diode Controller

The LTC4357 easily ORs power sources to increase total system reliability. In diode-OR applications, the LTC4357 controls the forward voltage drop across the MOSFET to ensure smooth current transfer from one path to the other without oscillation. If the power source fails or is shorted, a fast turn-off minimizes reverse current transients.

Features:

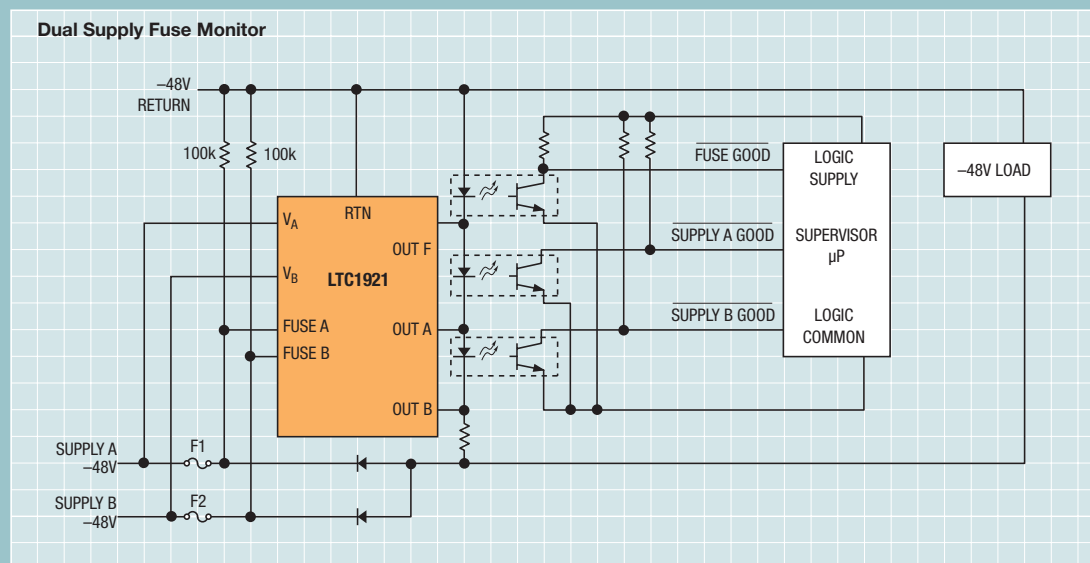

- Reduces Power Dissipation by Replacing a Power Schottky Diode with an N-Channel MOSFET
- 0.5 μ s Turn-Off Time Limits Peak Fault Current
- Wide Operating Voltage Range: 9V to 80V
- Smooth Switchover without Oscillation
- No Reverse DC Current
- Available in 6-Lead (2mm \times 3mm) DFN and 8-Lead MSOP Packages

Part Number	Input Supply Range	Ideal Diode	External FET	Fault Monitoring	Package
High Voltage Ideal Diode Controllers					
LTC4354	-4.5V to -100V (Floating)	Dual	N-Channel	Yes	3x2 DFN-8, SO-8
LTC4355	9V to 80V	Dual	N-Channel	Yes	4x3 DFN-14, SO-16, MSOP-16
LTC4357	9V to 80V	Single	N-Channel	No	2x3 DFN-6, MSOP-8

48V Fuse Monitor

The LTC1921 monitors two independent -48V supplies, including their fuses and drives up to three optoisolators to indicate status. Requiring only three noncritical resistors and optoisolators, the LTC1921 replaces multiple voltage comparators, a voltage reference and several precision resistors.

Part Number	Input Voltage Range	UV	OV	Package
Fuse Monitor				
LTC1921	-10V to -80V	Yes	Yes	MSOP-8, SO-8

Ideal Diodes and Controllers – Low Voltage

LTC4352: Low Voltage Ideal Diode Controller with Monitoring

The LTC4352 is a 0V to 18V ideal diode controller that enables low loss ORing of multiple power sources with minimal disturbance to supply voltages. A fast turn-on reduces the load voltage drop during supply switchover. Power passage is disabled during undervoltage or overvoltage conditions. The controller also features an open MOSFET detect circuit that flags excessive voltage drop across the pass transistor in the on state. A REV pin enables reverse current, overriding the diode behavior when desired.

Features:

- Low Loss Replacement for Power Diode
- Controls N-Channel MOSFET
- 0V to 18V Supply ORing or Holdup
- 0.5 μ s Turn-On and Turn-Off Time
- Undervoltage and Overvoltage Protection
- Open MOSFET Detect
- Status and Fault Outputs
- Hot Swappable
- Reverse Current Enable Input
- 12-Pin MSOP and DFN (3mm \times 3mm) Packages

LTC4358: 5A Ideal Diode

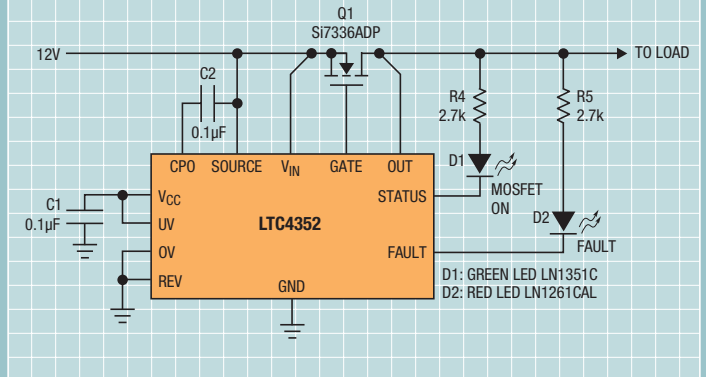

The LTC4358 is a 5A ideal diode that uses an internal 20m Ω N-channel MOSFET to replace a Schottky diode when used in diode-OR and high current diode applications. The LTC4358 reduces power consumption, heat dissipation, and PC board area.

Features:

- Replaces a Power Schottky Diode
- Internal 20m Ω N-Channel MOSFET
- 0.5 μ s Turn-Off Time Limits Peak Fault Current
- Operating Voltage Range: 9V to 26.5V
- Smooth Switchover without Oscillation
- No Reverse DC Current
- Available in 14-Pin (4mm \times 3mm) DFN and 16-Lead TSSOP Packages

Part Number	Input Supply Range	Ideal Diode	External FET	Package
5A Ideal Diode				
LTC4352	0V to 18V	Single, Fast Turn-On and Turn-Off	N-Channel	3x4 DFN-12 MSOP-12
LTC4358	9V to 28V	Single	Internal 5A FET	4x3 DFN-14 TSSOP-16
LTC4412	2.5V to 28V	Single	P-Channel	ThinSOT™
LTC4412HV	2.5V to 36V	Single	P-Channel	ThinSOT
LTC4414	3V to 36V	Single	P-Channel	MSOP-8

12V Ideal Diode with Status and Fault Indicators

Power Dissipation vs Load Current

12V, 5A Diode-OR

Introduction to DC/DC Controllers

High density power systems require very high efficiency, excellent power density and ease of implementation. Linear Technology offers a family of high performance DC/DC controllers specifically tailored for isolated power conversion for input voltages ranging from 4V to 100V for telecom, datacom and industrial applications. We feature primary- and secondary-side control ICs, which provide synchronous rectification, fast transient response, overvoltage and overcurrent protection and a host of other features. These devices enable output voltages from 0.6V to 52V from flyback, forward, half-bridge, push-pull or full-bridge topologies. Off-the-shelf planar magnetics can be used in many applications, reducing design complexity.

Flyback Controllers – Low Power (Up to 60W)

Synchronous and non-synchronous flyback controllers are offered for output power levels up to 60W. This family of current mode flyback controllers can either regulate the output voltage with integrated primary-side regulation circuitry or can be used with a secondary-side optocoupler driver and optoisolator. Synchronous rectification is easily controlled by the LT3825 or LT3837, which increases conversion efficiency and improves output cross regulation in multiple output power supplies. As an example, the LT3825 can convert an input supply of 36V-75V to an isolated output of 3.3V at 12A with up to 90% efficiency.

Isolated Synchronous Rectified No-Opto Flyback Converter

LTC3803-3 Isolated Demo Board

Part Number: DC1100A

V_{IN} : 18V to 75V

Output: 3.3V at 3A

Low Power Isolated Flyback Converter

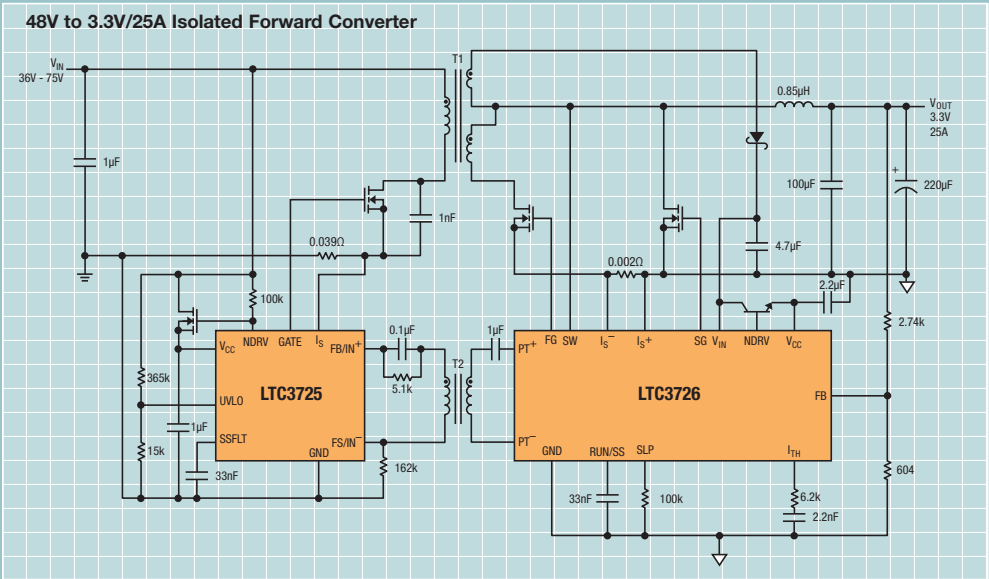

Flyback Controllers/Monolithic – Low Power (Up to 60W)

Part Number	Maximum Output ¹ Power (W)	V _{IN} Range (V)	V _{OUT} ³ Range (V)	Operating Frequency	Package	Description
Primary-Side Flyback Controllers/Monolithic						
LT3573	7	3 to 40	1.23 to 52	40kHz to 1MHz	MSOP-16E 3x3 QFN-16	No-Opto Flyback with Integrated Power Switch

² The operating frequency can be selected within the range indicated.
³ The input and output voltage range depends on external components. For higher voltages, consult factory.

Forward Controllers – Medium Power (Up to 300W)

Linear Technology’s single switch and 2-switch forward controllers normally operate with primary and secondary-side ICs for control, timing and driving of synchronous MOSFETs. The single switch forward converter schematic below shows the LTC3706 as a secondary-side controller with primary-side LTC3725 smart driver. Efficiencies up to 95% are achieved with this circuit for output voltages ranging from 0.6 to 52V.

Forward Controllers/Smart Drivers – Medium Power (Up to 300W)

Part Number	MOSFET Drive Current	V_{IN}^3 Range (V)	Operating Frequency ²	Package	Description
Primary-Side Smart Drivers					
LTC3705	2A	9 to 75	70kHz to 700kHz	SSOP-16	2-Switch Forward Smart Gate Driver, Works with Secondary-Side Synchronous Controller LTC3706 or LTC3726
LTC3725	2A	9 to 75	70kHz to 700kHz	MSOP-10E	Single-Switch Forward Smart Gate Driver, Works with Secondary-Side Synchronous Controller LTC3706 or LTC3726

Part Number	Output ¹ Power Range (W)	V_{CC} Range (V)	V_{OUT} Range (V)	Operating Frequency ²	Package	Description

³ The input voltage range depends on external components. For higher voltages, consult factory.

Demonstration Boards – Isolated Solutions for Telecom and Datacom Applications

Linear Technology offers demonstration boards for a wide variety of applications, including isolated and nonisolated power supplies. In addition to the demonstration board, we supply the electrical schematic, bill of materials and Gerber files for the PCB design. We also include a Quick Start Guide that describes the circuit operation and provides performance curves, including load regulation, ripple and noise, efficiency and transient response.

We can also develop customized solutions if the exact demo board for a specific requirement does not exist. Contact your local sales representative for further details.

Below are photos of standard demo boards showing the industry-standard size 1/8 brick, measuring 0.9" x 2.3", and 1/4 brick, measuring 1.45" x 2.3" form factors. Both convert a 36V to 75V input to isolated output voltages ranging from 0.6V to 52V. Efficiencies up to 95% are realized using off-the-shelf planar power transformers and inductors.

¹ These designs utilize active transformer reset.

² These boards are designed to be paralleled for higher current applications.

Isolated Solutions for Industrial Applications

Many industrial applications demand isolation and high efficiency at lower input voltages. Linear Technology offers multiple controllers specifically designed for isolated power conversion from 12V and 24V sources. Advantages of these solutions include reduced complexity, synchronous rectification and the ability to accommodate other output voltages and power levels with relatively minor changes to existing designs. Leveraging these flyback and forward solutions results in shorter design cycles and flexible designs.

LT3573 Isolated Demo Board

Part Number: DC1228A

V_{IN} : 10V to 30V

Output: 5V at 1A

LTC3725/LTC3726 Isolated Demo Board

Part Number: DC1174A-A

V_{IN} : 9V to 36V

Output: 5V at 10A

Push-Pull, Half- and Full-Bridge Controllers – High Power (100W to 750W)

The LTC3721 and LTC3723 controllers are well suited for power levels from 100W to 750W, providing simple solutions for high power applications. Synchronous and non-synchronous rectification modes of operation are supported. The push-pull, half- and full-bridge configurations offer smaller input filter and output inductors compared to single-ended converters. They also provide up to 40% greater transformer utilization and balanced semiconductor power dissipation over the input voltage range.

Part Number	Output ¹ Power Range (W)	V _{IN} ³ Range (V)	V _{OUT} Range (V)	Operating Frequency ²	Package	Description
Primary-Side Push-Pull, Half-Bridge and Full-Bridge Controllers						
LTC3721-1	100 to 750	10.7 to 75	1.2 to 52	Up to 1MHz	SSOP-16 4x4 QFN-16	Push-Pull and Full-Bridge Non-Synchronous Topologies
LTC3723-1	100 to 750	10.7 to 75	1.2 to 52	Up to 1MHz	SSOP-16	Push-Pull and Full-Bridge Current Mode Synchronous Topologies
LTC3723-2	100 to 750	10.7 to 75	1.2 to 52	Up to 1MHz	SSOP-16	Push-Pull, Half-Bridge and Full-Bridge Voltage Mode Synchronous Topologies

¹ The maximum output power depends on the choice of external components.
² The operating frequency can be selected within the range indicated.
³ The input voltage range depends on external components. For higher voltages, consult factory.

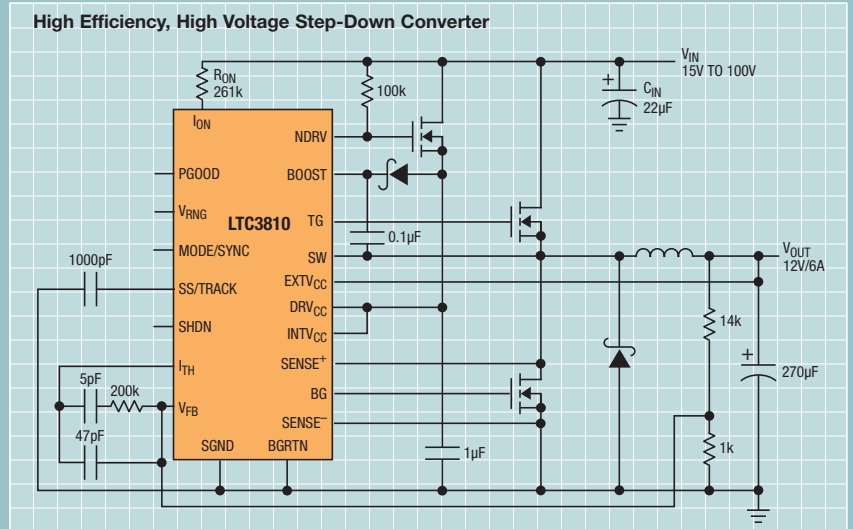

Introduction

Linear Technology offers controllers, monolithic switching regulators and linear regulators for high voltage (up to 100V) nonisolated step-down (buck) and step-up (boost) DC/DC power conversion. Topologies include synchronous and non-synchronous buck, boost, buck-boost, forward and flyback converters. Included are low quiescent current controllers and monolithic parts that help preserve battery life during standby mode.

Buck and Boost Controllers – High Voltage

Shown below are synchronous and non-synchronous buck and boost controllers that operate from input voltages up to 100 volts. Selection parameters include output voltage range, operating frequency, quiescent current and choice of sense resistor.

LTC3810 Demo Board

Part Number	V_{IN} Range (V)	V_{OUT} Range (V)	Max Output Current (A) ¹	Synchronous Operation	Operating Frequency ²	No Sense Resistor	Package

¹The maximum output current depends on the choice of external components.

²The frequency can be selected within the range indicated.

³The output voltage depends upon external components.

Forward Controllers

The forward converter is the preferred topology for very high step-down ratio nonisolated applications. This topology produces a higher efficiency converter when stepping down from 48V to voltages below 5V versus a conventional buck and allows the use of smaller input and output capacitors.

Part Number	V_{IN} Range (V) ⁴	V_{OUT} Range (V)	Max Output Current (A) ¹	Synchronous Operation	Operating Frequency ²	I_Q (SUPPLY)	Package
Forward Controllers							
LT1952	15.75 to 75	1.23 to 52	40		100kHz to 500kHz	5.2mA	SSOP-16
LT1952-1	8 to 75	1.23 to 52	40		100kHz to 500kHz	5.2mA	SSOP-16
LTC3706 ³	5 to 75	0.6 to 52	50	x	70kHz to 500kHz	4.2mA	SSOP-24
LTC3726 ³	5 to 75	0.6 to 52	50	x	70kHz to 500kHz	4.2mA	SSOP-16

¹ The maximum output current depends on the choice of external components.

² The frequency can be selected within the range indicated.

³ These ICs can be used in paralleled converters for higher current applications.

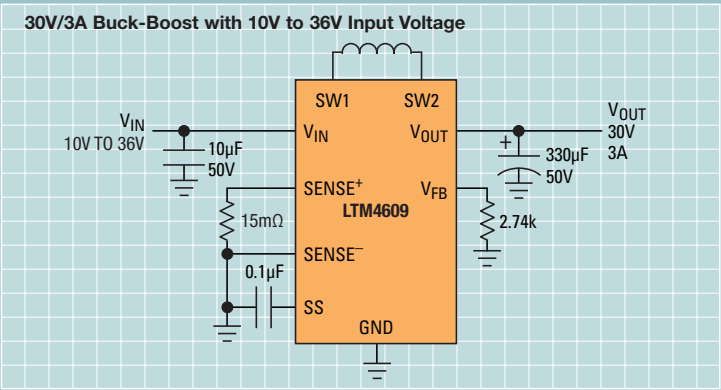

⁴ For higher input voltages, consult factory.

Synchronous Buck-Boost

Linear offers high performance synchronous buck-boost μModule regulators and controllers that operate from input voltages that can be above, below or equal to the output voltage. These devices utilize a single inductor and can deliver efficiencies up to 98%.

Optocoupler Driver/Reference Voltage

The LT4430 drives optoisolators that cross the isolation barrier in an isolated power supply. The IC contains a precision-trimmed reference and a high bandwidth error amplifier. The LT1431 is an adjustable shunt voltage regulator with 100mA sink capability and ±0.2% initial reference voltage accuracy.

Part Number	Driver Current Limit (mA)	Initial Accuracy	Tolerance Over Temp Range	Reference Voltage (V)	Package
Optocoupler Driver/Reference Voltage					
LT4430	10	+/-0.75%	+/-1.25% (-40°C to 125°C)	0.6	ThinSOT™
LT1431	100	+/-0.2%	+/-1.4% (-40°C to 85°C)	2.5	S-8/N-8/TO-92

Power over Ethernet Controllers

Building on industry-leading Hot Swap technology, Linear Technology offers cost effective solutions for delivering Power over Ethernet (PoE), including controllers for Power Sourcing Equipment (PSE) and Powered Devices (PD).

Linear Technology offers both single and multiport PSE controllers to satisfy any PoE requirement. The LTC4263-1 is an autonomous single-channel PSE controller for use in IEEE 802.3af compliant PoE systems. It includes an onboard power MOSFET, inrush current limit and short-circuit control, and PD detection and classification circuitry. Onboard control algorithms provide complete IEEE 802.3af compliant operation without the need for a microcontroller. The

LTC4263-1 simplifies PSE implementation, requiring only a single 48V supply and a few passive support components.

The LTC4266 quad, high power PSE controller meets the requirements of the new IEEE 802.3at (PoE+) specification and includes advanced features such as true 14-bit port current and voltage readback, programmable power levels for enforcing classification, and industry-leading power efficiency.

Linear Technology offers a wide array of solutions for PD applications, including the new, high power LTC4269 PD with integrated switcher family. The LTC4269 family offers IEEE 802.3at compatibility, flexible auxiliary power options and switcher efficiencies as high as 96%.

LTC4269-1/-2: IEEE 802.3at PD Controllers with Integrated Switchers

Features:

- 25.5W IEEE 802.3at Compliant (Type-2) PD
- IEEE 802.3at High Power Available Indicator
- Integrated Synchronous No-Opto Flyback Controller or Synchronous Forward Controller
- Superior EMI Performance
- Programmable Soft-Start and Switching Frequency
- Flexible Integrated Auxiliary Power Support
- Robust 100V Integrated Hot Swap MOSFET
- Undervoltage, Overvoltage and Thermal Protection
- Available in Compact 32-Pin 7mm x 4mm DFN Package

Part Number	PSE/PD	Channels	Description	IEEE-Compliant Detection	IEEE-Compliant Disconnection	Package

Rugged Serial Interface Transceivers

Linear Technology offers a broad selection of industry standard, low power RS485/RS422, RS232/RS562 and CAN interface transceivers featuring high ESD protection, high speed and high voltage versions for rugged environments. Our family of RS485 transceivers includes models that feature fail-safe receiver inputs that guarantee a receiver output high for shorted, open or inactive data lines. Select models feature slew rate limiting to lower EMI, while others include a receiving logic-selectable 120 Ω termination. All devices are designed to operate in systems with either 3.3V or 5V supplies, possess a maximum data rate of 20Mbps and maintain a high input impedance capable of supporting up to 256 nodes. Fault-protected devices are equipped with $\pm 60\text{V}$ overvoltage protection, eliminating a common cause of failure, cross-wiring bus terminals to a supply rail. Our transceivers are equipped with enhanced on-chip ESD protection, up to $\pm 25\text{kV}$ HBM, which guarantees no damage or latchup can occur.

LTC2854: 3.3V 20Mbps RS485/RS422 Transceiver with Integrated Switchable Termination

Features:

- Integrated, Logic-Selectable 120 Ω Termination Resistor
- 3.3V Supply Voltage
- 20Mbps Maximum Data Rate
- No Damage or Latchup Up to $\pm 25\text{kV}$ HBM
- High Input Impedance Supports 256 Nodes (C, I-Grade)
- Operation Up to 125 $^{\circ}\text{C}$ (H-Grade)
- Guaranteed Failsafe Receiver Operation Over the Entire Common Mode Range
- Current Limited Drivers and Thermal Shutdown
- Delayed Micropower Shutdown: 5 μA Maximum (C, I-Grade)
- Power Up/Down Glitch-Free Driver Outputs
- Low Operating Current: 370 μA Typical in Receive Mode
- Compatible with TIA/EIA-485-A Specifications

I²C and SMBus Buffers and Accelerators

Linear Technology bus buffers and rise time accelerators offer capacitive isolation and active pull-up currents to eliminate common 2-wire bus problems that occur when many nodes are added to a system management bus such as I²C or SMBus. These busses are commonly used in high availability (Hot Swap) environments. The enhanced data transmission speed and reliability, coupled with robust ESD structures, makes these devices suitable for many industrial applications.

LTC4309: Level Shifting Low Offset Hot Swap Capable 2-Wire Bus Buffer with Stuck Bus Recovery

Features:

- Bidirectional Buffer Increases Fanout
- 60mV Buffer Offset Independent of Load
- Optional Disconnect when Bus is Stuck Low
- Prevents SDA and SCL Corruption During Live Board Insertion and Removal from Backplane
- Level Shift 2.5V, 3.3V and 5V Busses
- Compatible with Non-Compliant V_{OL} I²C Devices
- ±6kV Human Body Model ESD Ruggedness
- Isolates Input SDA and SCL Lines from Output
- Compatible with I²C, I²C Fast-Mode and SMBus
- READY Open Drain Output
- FAULT Open Drain Output
- 1V Precharge on All SDA and SCL Lines
- Optional Rise Time Accelerators
- High Impedance SDA, SCL Pins for V_{CC} = 0
- Available in Small 12-Pin DFN (4mm x 3mm) and 16-Lead SSOP Packages

Stuck Bus Resolved with Automatic Clocking

Part Number	Bus Buffer	Rise Time Acceleration	Level Translation	Maximum Data Rate	ESD	Description	Packages

LTC4308	Yes	Yes	1V to 2.5V/5V	400kHz	±6kV	Optimized for Low Voltage Systems Down to 0.9V	MSOP-8, 3x3 DFN-8
LTC4309	Yes	Yes	2.5V/3.3V/5V	400kHz	±6kV	Low Offset, Hot Swap Capable, Stuck Bus Recovery, Fault Flag	SSOP-16, 4x3 DFN-12

¹Buffer V_{CC} <= V_{BUS}

System Monitoring and Control

Linear Technology's System Monitoring and Control portfolio includes an extensive selection of power supply voltage supervisors, power monitors, trackers, margining controllers, sequencers and pushbutton controllers designed to simplify system control. All of these devices improve DC/DC converter functionality and feature a high degree of accuracy, integration and configurability, resulting in cost-efficient designs and simplified system circuitry.

The System Monitor and Control family provides convenient all-in-one solutions for many of today's growing digital power management applications.

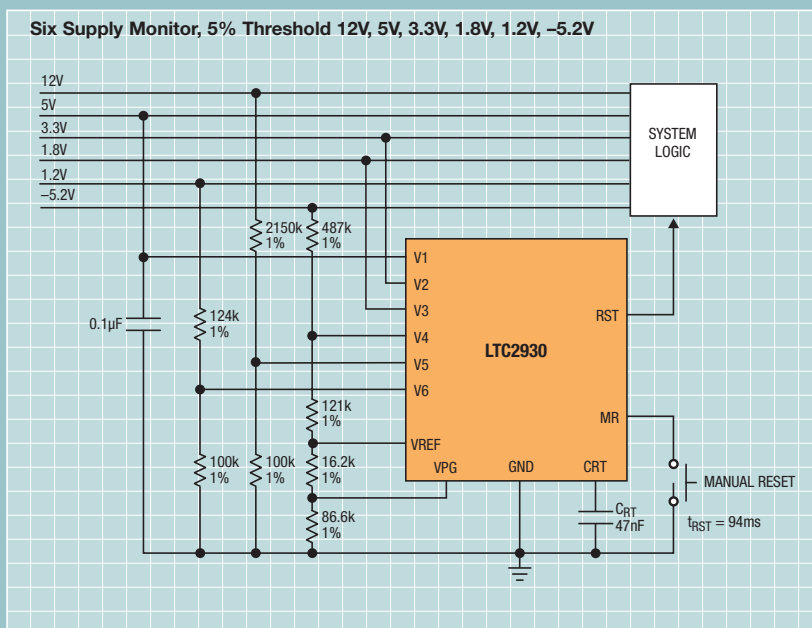

Voltage Monitors and Supervisors

This family includes power supply voltage monitors ranging from 0.5V to 27V, with integration of up to eight supply monitors in tiny packages. Many of these devices feature adjustable inputs, accurate user-selectable voltage thresholds, UV/OV/Negative monitoring, watchdog timers and low supply currents.

LTC2930: Configurable Six Supply Monitor with Adjustable Reset Timer and Manual Reset

Features:

- Simultaneously Monitors Six Supplies
- 16 User Selectable Combinations of 5V, 3.3V, 3V, 2.5V, 1.8V, 1.5V and \pm Adjustable Voltage Thresholds
- Guaranteed $\pm 1.5\%$ Threshold Accuracy
- Adjustable Reset Timeout
- Low Supply Current: 52 μ A
- Manual Reset Pin
- Power Supply Glitch Immunity
- Guaranteed RST for $V_{CC} \geq 1V$
- High Temperature Operation up to 125°C
- 12-Pin 3mm x 3mm DFN Package

Part Number	Number of Supplies	Overvoltage Monitoring	Negative Monitoring	Watchdog Timer	Reset Pulse Width	Temperature Grades	Description	Packages
Voltage Monitors and Supervisors								
LTC2917/2918	1	No	No	Yes	Adj	C, I, H	Low Voltage with 27 Selectable Thresholds and Watchdog Timer	MS-10, DFN-10
LTC2904/05	2	No	No	No	200ms/Adj	C, I	Pin-Selectable Thresholds and Tolerances of 5%, 7.5%, 10%	SOT-23-8 DFN-8
LTC1326/-2.5	3	No	No	No	200ms	C, I	Long Duration Manual Reset Input	SO-8, MS-8
LTC2914	4	Yes	Yes	No	Adj	C, I, H	Quad UV/OV Positive/Negative Voltage Monitor	SSOP-16 DFN-16
LTC2908	6	No	No	No	200ms	C, I	Precision Six Supply Monitor	SOT-23-8 DFN-8
LTC2931/2932	6	No	Yes	Yes	Adj	C, I, H	Configurable Supplies, Adj Reset Timer and Supply Tolerance	TSSOP-20
LTC2910	8	Yes	Yes	No	Adj	C, I, H	Octal Positive/Negative Voltage Monitor	SSOP-16 DFN-16

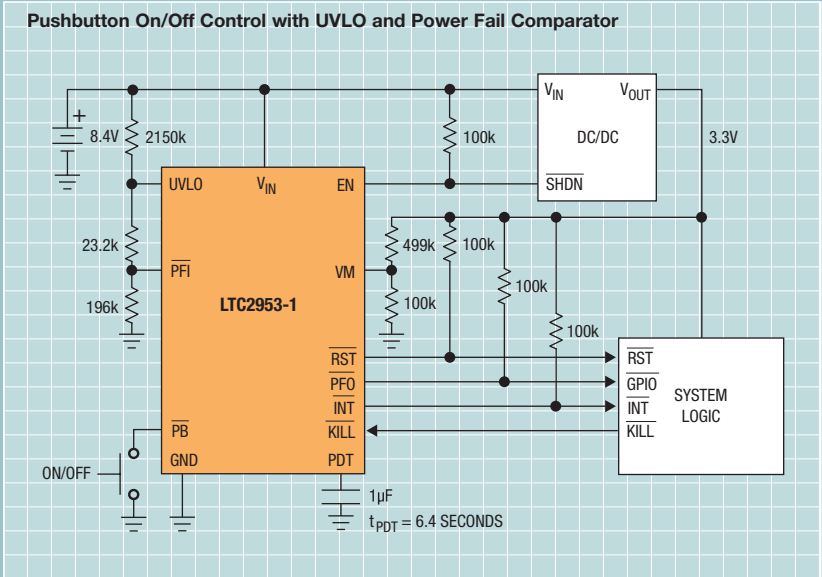

Pushbutton Controllers

Pushbutton controllers enable control for DC/DC converters, processor interrupt logic and adjustable on/off timers. They easily solve the inherent bounce problem associated with all mechanical contacts, while also enabling power supply converters and releasing a processor once the supply is fully powered up. These parts offer wide supply voltage range, small size, low quiescent current and ease of design when compared to discrete solutions.

LTC2953: Pushbutton On/Off Controller with Voltage Monitoring

Features:

- Wide Operating Voltage Range: 2.7V to 27V
- Pushbutton Control of System Power
- Low Supply Current: 14µA
- Power Fail Comparator Generates Warning
- UVLO Comparator Gracefully Latches Power Off
- Adjustable Supply Monitor with 200ms Reset
- Adjustable Power Down Timer
- Low Leakage EN Output (LTC2953-1) Allows DC/DC Converter Control
- High Voltage EN Output (LTC2953-2) Allows Circuit Breaker Control
- Simple Interface Allows Orderly System Power Up and Power Down
- ±1.5% Threshold Tolerances
- ±10kV ESD HBM on PB Input

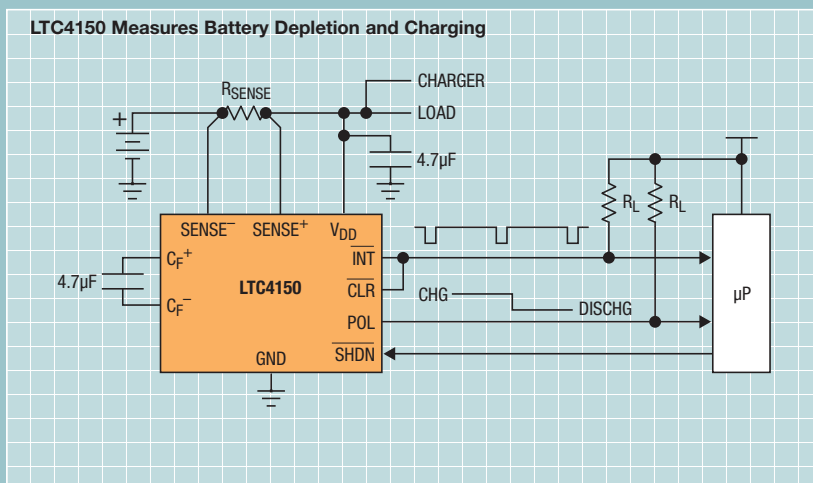

Part Number	Supply Voltage Range	I _{SUPPLY} (µA)	Description	Packages
Pushbutton Controllers				
LTC2950	2.7V to 26V	6	Active H/L Enable Output with Adjustable Pushbutton On/Off Debounce Timers	3x2 DFN-8, SOT-23
LTC2951	2.7V to 26V	6	Active H/L Enable Output with Adjustable Pushbutton Off/Kill Timers	3x2 DFN-8, SOT-23
LTC2952	2.7V to 28V	25	Pushbutton PowerPath™ Controller with Supervisor	TSSOP-20, 4x4 QFN-20
LTC2953	2.7V to 27V	14	Adjustable Power Supply Monitoring with UVLO and Power Fail Comparators	3x3 DFN-12
LTC2954	2.7V to 26V	6	Adjustable On/Off Debounce Timers. Interrupt Logic Ideal for Menu Driven Applications	3x2 DFN-8, SOT-23

LTC4150: Coulomb Counter/Battery Gas Gauge

The LTC4150 measures battery depletion and charging in handheld PC and portable product applications. The device monitors current through an external sense resistor between the battery's positive terminal and the battery's load or charger. A voltage-to-frequency converter transforms the current sense voltage into a series of output pulses at the interrupt pin. These pulses correspond to a fixed quantity of charge flowing into or out of the battery. The part also indicates charge polarity as the battery is depleted or charged. The LTC4150 is intended for 1-cell or 2-cell Li-Ion and 3-cell to 6-cell NiCd or NiMH applications.

Features:

- Indicates Charge Quantity and Polarity
- $\pm 50\text{mV}$ Sense Voltage Range
- Precision Timer Capacitor or Crystal Not Required
- 2.7V to 8.5V Operation
- High Side Current Sense
- 32.55Hz/V Charge Count Frequency
- 1.5 μA Shutdown Current
- 10-Lead MSOP Package

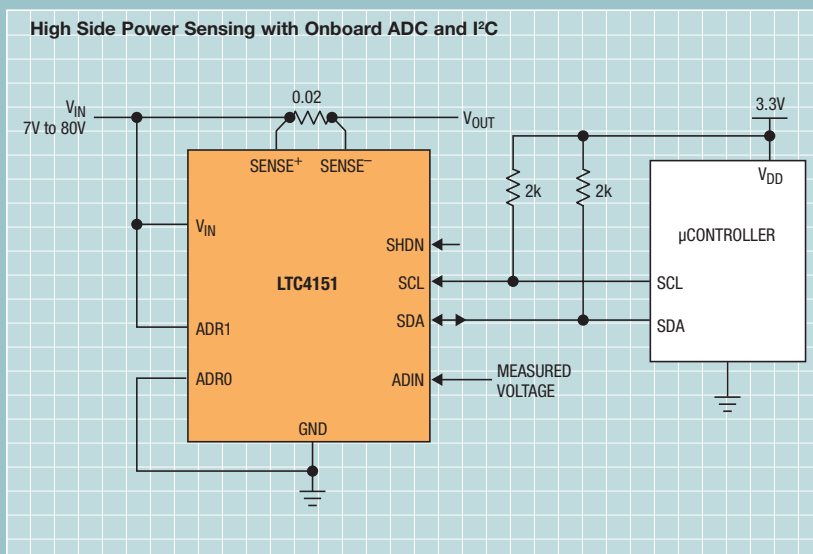

LTC4151: High Voltage I²C Current and Voltage Monitor

The LTC4151 and LTC4151-1 are high side power monitors that operate over a wide voltage range of 7V to 80V. In default operation, the onboard 12-bit ADC continuously measures high side current, input voltage and an external voltage. Data is reported through the I²C interface when polled by a host. The monitors can also perform on-demand measurement in a snapshot mode. The LTC4151 features a dedicated shutdown pin to reduce power consumption. The LTC4151-1 features split I²C data pins with data in and an inverted data output to drive optoisolators.

Features:

- Wide Operating Voltage Range: 7V to 80V
- 12-Bit Resolution for Both Current and Voltages
- I²C Interface
- Additional ADC Input Monitors an External Voltage
- Continuous Scan and Snapshot Modes
- Shutdown Mode (LTC4151) Reduces Quiescent Current to 120 μA
- Split SDA for Optoisolation (LTC4151-1)
- Tiny 10-Lead MSOP and 3mm \times 3mm DFN Packages

Supply Trackers, Sequencers and Margining Controllers

Energy efficiency and power consumption are critical factors in today's electronic designs. With many different voltage rails supplying large load currents, managing power consumption and optimizing, overall efficiency can be a challenge. This family of power supply controllers allows users to select the sequence of power supply ramp-up and ramp-down, and actively control the outputs, including support for DC/DC converter modules. In addition, users have the option of tracking supplies in a coincident, offset or ratiometric fashion, as well as margining the supplies, and allow for the testing of supply voltage limits as specified by the system.

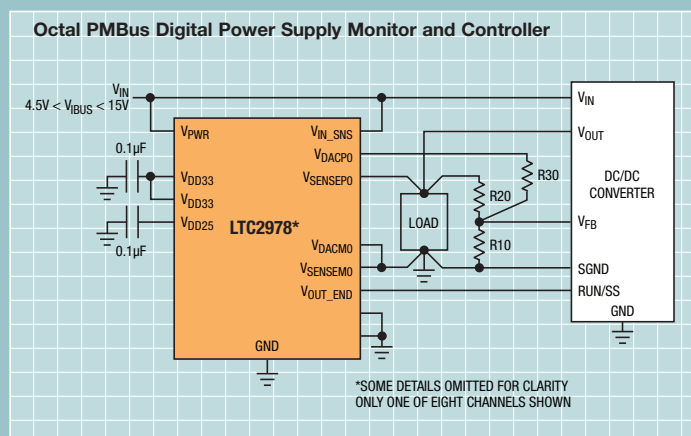

The LTC2970 and LTC2978, dual and octal controllers, offer digital power management of analog supplies to ensure precise trimming, margining and monitoring using on-chip high resolution ADCs and DACs. The LTC2970/LTC2978 work with almost any power supply, allowing designers to choose the optimal DC/DC converter that provides smooth control of the output voltage and a fast transient response. An on-chip reference and high accuracy $\Delta\Sigma$ A/D converter ensure accurate measurements of supply voltages, load currents or temperature. Voltage-buffered DACs drive the supplies' feedback nodes for improved accuracy and can be programmed by a slow, linear voltage servo to trim and margin the output voltages. This is extremely useful in determining the load's sensitivity to the power supply during the prototype phase or to test for manufacturing variations in production.

Extensive, user-configurable fault monitoring provides increased reliability, alerting a system's host to incipient failures before they occur. The LTC2978 also includes a configuration EEPROM with fault logging. The $\Delta\Sigma$ ADC architecture was specifically chosen to average out power supply noise and allow fast transients. The point of load ground reference for the DAC outputs minimizes errors that would otherwise occur in a power system that experiences ground bounce.

LTC2978: Octal PMBus Power Supply Monitor and Controller with EEPROM

Features:

- PMBus Compliant Interface and Command Set
- Configuration EEPROM
- Fault Logging to Internal EEPROM
- Differential Input, 15-Bit $\Delta\Sigma$ ADC with Less Than $\pm 0.25\%$ of Total Unadjusted Error
- Monitors Eight Output Channels and One Input Voltage 8-Channel Sequencer
- Programmable Watchdog Timer
- Eight UV/OV Voltage Supervisors
- Eight 10-Bit Voltage-Buffered IDACs with Soft Connect
- Linear, Voltage Servo Adjusts Supply Voltages by Ramping Voltage-Buffered IDAC Outputs Up/Down
- Supports Multichannel Fault Management
- On-Chip Digital Temperature Sensor
- 64-Pin 9mm \times 9mm QFN Package

Part Number	Total Supplies	Supply Voltage (V)	Tracking via DC/DC Feedback	Sequencing	Input Monitors	Margining	PWRGD	Description	Package
